

Basic Concepts: Assets & Liabilities

I. Accounting for Inventories & Cost of Goods Sold (“COGS”)

A. Valuing Inventories & COGS

- Inventories are valued at **lower** of acquisition **cost** or **market** (LCM)
- **Cost**
 - Merchandise inventories: costs of purchasing, transportation, receiving, inspecting, etc.
 - Manufactured inventories: costs of direct materials, direct labor & manufactured overhead (i.e. all other indirect costs)
- **Market** is the current cost to replace inventory

[Example]

Which of the following methods is considered preferred for financial reporting purposes?

- A. capitalization of research and development costs
- B. lower of cost or market (LOCOM) for inventories
- C. direct write-off of doubtful (uncollectible) accounts
- D. MACRS for depreciation

Answer: B

-
- **Inventory Equation**

$$\boxed{\text{BI} + \text{P} = \text{EI} + \text{COGS}}$$

| | |
|---|----------------------------------|
| | Beginning Inventory (BI) |
| + | <u>Purchases (P)</u> |
| = | Cost of goods available for sale |
| - | <u>Ending Inventory (EI)</u> |
| = | <u>Cost of Goods Sold (COGS)</u> |

講師提示

期初存貨 + 進貨 = 銷貨成本 + 期末存貨 為存貨會計最基礎之關係。

[Example]

Compute the COGS based on the following info:

| | Beginning Inventory | Ending Inventory |
|-----------------|----------------------------|-------------------------|
| Raw Materials | NT\$1,000 | NT\$2,000 |
| Work-in-Process | 4,000 | 5,000 |
| Finished Goods | 6,000 | 8000 |
| | <hr/> | <hr/> |
| | <u>NT\$11,000</u> | <u>NT\$15,000</u> |

During an accounting period,

| | | |
|----------------------------------|---------|-----------|
| Raw Material Purchases | | NT\$8,000 |
| Direct Labor | | 10,000 |
| Factory Overhead: | | |
| Utilities | NT\$500 | |
| Depreciation | 600 | |
| Other | 200 | |
| Total | <hr/> | 1,300 |
| Freight Charges on Raw Materials | | 100 |
| General Administrative Overhead | | 1,700 |
| Interest Expense | | 400 |

Answer:

$$\boxed{\text{BI} + \text{P} = \text{EI} + \text{COGS}} \rightarrow \text{COGS} = \text{BI} + \text{P} - \text{EI}$$

Since BI = NT\$11,000; EI = NT\$15,000;

$$\text{P} = 8,000 + 10,000 + 1,300 + 100 = \text{NT\$19,400}$$

$$\text{COGS} = \text{BI} + \text{P} - \text{EI} = 11,000 + 19,400 - 15,000 = \underline{\text{NT\$15,400}}$$

[Example]

DJ Co understates its purchases by \$200 & understates its ending inventory by \$500.

$$\begin{aligned} \text{Since } \text{COGS} &= \text{BI} + \text{P} - \text{EI} \rightarrow \text{COGS} = \text{BI} + \text{P} - \text{EI} \\ &= 0 + (-200) - (-500) = +300 \text{ (overstated)} \\ &\rightarrow \text{(reported gross profit)} = -300 \text{ (understated)} \end{aligned}$$

- Methods of Inventory Accounting
 1. **FIFO**: typical actual flow of goods through a business where the oldest inventory is sold first (e.g. fish market)
 2. **LIFO**
 3. **Average cost**
 4. **Specific identification**

[Example]

| Date | Item | # of Unit | Actual units sold | Unit cost/price | Total amount |
|--------------|---------------------|-----------|-------------------|-----------------|--------------|
| 2003/1/1 | Beginning Inventory | 2 units | 1 unit | \$2 per unit | \$4 |
| 2003/1/8 | Purchase | 3 units | 2 units | \$3 per unit | \$9 |
| 2003/1/28 | Purchase | 5 units | 4 units | \$5 per unit | \$25 |
| January 2003 | Sales | 7 units | - | - | - |

$P = \$9 + \$25 = \$34$ for (3 units + 5 units = 8 units)

Cost of Goods available for sale = $BI + P = \$4 + \$34 = \$38$

Total # of units available for sale = $BI + P = 2 \text{ units} + 8 \text{ units} = 10 \text{ units}$

Average unit cost of goods available for sale = $\$38/10 \text{ units} = \3.8 per units

$EI = BI + P - \text{units sold} = 10 \text{ units} - 7 \text{ units} = 3 \text{ units}$

FIFO: $EI = 3 \text{ units} \times \$5 \text{ per unit} = \underline{\$15}$
 $COGS = BI + P - EI = \$38 - \$15 = \underline{\$23}$

LIFO: $EI = (2 \text{ units} \times \$2 \text{ per unit}) + (1 \text{ unit} \times \$3 \text{ per unit}) = \underline{\$7}$
 $COGS = BI + P - EI = \$38 - \$7 = \underline{\$31}$

Average cost: $EI = 3 \text{ units} \times \$3.8 \text{ per unit} = \underline{\$11.4}$
 $COGS = BI + P - EI = \$38 - \$11.4 = \underline{\$26.6}$

Specific identification: $EI = \$2 + \$3 + \$5 = \underline{\$10}$
 $COGS = BI + P - EI = \$38 - \$10 = \underline{\$28}$

The Lower-of-Cost-or-Market Principle: If FIFO is used & the fair market value of the units in the ending inventory is \$12, an ***unrealized loss*** of \$3 is recognized on the income statement.

B. The Influence of Inventory Valuation on Financial Statements

- Analytical implications:

If financial statements are analyzed and compared with firms using different cost flow assumptions, adjustments have to be made to achieve comparability.

Most US firms use LIFO on their statements

- IRS rules state that if firms use LIFO on tax returns, they must use LIFO on general-purpose statements
- During periods of rising prices, firms have **saved money** by using LIFO on tax returns as reported net income is lower → **CFO**

Effect on Income, Assets, & Cash Flow

- In the absence of taxes → no difference in cash flow between LIFO & FIFO
- In the periods of rising prices & stable or inventory quantities:

| <u>rising prices</u> | FIFO | LIFO |
|-----------------------|-------------|-------------|
| Inventory balances | | |
| COGS | | |
| Net income(EBT & EAT) | | |
| Taxes | ■ | ■ |
| Working capital | | |
| Cash flows | ■ | ■ |

With rising prices, LIFO is the best choice from an economic (income) perspective

LIFO firm liquidity measures are misleading due to understatement of working capital

FIFO firms show higher net income (all else the same)

LIFO liquidation: By decreasing inventory to levels below normal level, thus dipping into old “cheap” inventory (e.g. sells more items than purchased during the period), a firm’s management can manipulate profits under LIFO. Now COGS under LIFO will be low & profit high

- LIFO COGS and, hence, income are distorted
- COGS doesn’t reflect current costs

To maximize the value of a firm, the method which minimizes taxes & maximizes net cash flow is usually chosen by the management. Under normal conditions of secular inflation & real economic growth, this often leads to choosing LIFO

C. Converting LIFO Statements into FIFO equivalents

- Current cost of inventory (FIFO) = LIFO inventory + LIFO reserve
- To adjust the balance sheet:

| | |
|---|--|
| Inventory: (LIFO basis → FIFO basis) + LIFO reserve | Retained Earning: + (LIFO reserve) x (1-t) Deferred tax liability: + (LIFO reserve) x (t) |
|---|--|

- Adjustment of COGS:

$$\text{Since } \text{COGS}_L = \text{BI}_L + \text{P}_L - \text{EI}_L$$

$$\text{COGS}_F = \text{BI}_F + \text{P}_F - \text{EI}_F$$

$$\Delta \text{COGS} = \text{COGS}_L - \text{COGS}_F$$

$$= (\text{BI}_L + \text{P}_L - \text{EI}_L) - (\text{BI}_F + \text{P}_F - \text{EI}_F)$$

$$\text{And, LIFO Reserve (LR)} = \text{I}_F - \text{I}_L$$

$$\Delta \text{COGS} = (\text{EI}_F - \text{EI}_L) - (\text{BI}_F - \text{BI}_L)$$

$$= \text{LR}_E - \text{LR}_B = \Delta \text{LR}$$

$$\text{FIFO COGS} = \text{LIFO COGS} - \Delta \text{LIFO Reserve}$$

$$\text{FIFO Net Income} = \text{LIFO Net Income} + [\Delta \text{LIFO Reserve} \times (1-t)]$$

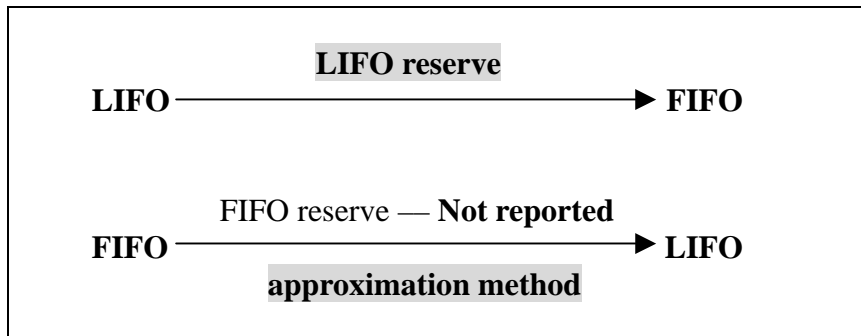

[Example]

| | 2002 | 2003 |
|-------------------------------|------|-------|
| End-of-year inventory balance | \$50 | \$70 |
| LIFO reserve | \$20 | \$30 |
| COGS | - | \$300 |

If the company uses LIFO, convert 2003 ending inventory & COGS to a FIFO-basis.

$$\text{FIFO inventory} = \text{LIFO inventory} + \text{LIFO reserve} = \$70 + \$30 = \underline{\$100}$$

$$\text{FIFO COGS} = \text{LIFO COGS} - \Delta \text{LIFO Reserve} = \$300 - (30 - 20) = \underline{\$290}$$

- Don't have to adjust FIFO ending inventory since it is theoretically already at current cost

Declines in LIFO Reserve

- LIFO Reserve will decline if
 - ◆ Inventory quantity is falling (LIFO liquidation) → need to adjust:

$$\text{COGS}_F = \text{COGS}_L - \Delta \text{LR}$$

- ◆ Prices are falling → no need to adjust

- If prices are falling or there's a LIFO liquidation, the **LIFO reserve (LR)** and **Δ LR** will be negative:

| falling prices or LIFO liquidation | FIFO | LIFO |
|---|-------------|-------------|
| Inventory balances | | |
| COGS | | |
| Net income (EBT & EAT) | | |
| Taxes | | |
| Working capital | | |
| Cash flows | | |

D. Effect of Inventory Accounting Choices on Key Financial Ratios

- Interpretation of Inventory

1. Inventory Balances

For **balance sheet** purposes, **inventories** based on **FIFO** are **preferable** since these values most closely resemble **current cost** & hence **current economic value**

2. Earnings

Going concern assumption implies that income should be measured in terms of profits after providing for the **replacement of inventory**

For **income statement** purposes, **LIFO** is **most informative** accounting method & provides a **better measure** of **current income**

- FIFO: better balance sheet measure $\leftarrow \rightarrow$ LIFO: better income statement

measure $\rightarrow \rightarrow \rightarrow$ Restate financial statements \rightarrow better analysis

- Effect on Ratios

| <u>rising prices</u> | FIFO | LIFO |
|---------------------------|-------------|-------------|
| Ending Inventory balances | | |
| Current ratio * | ■ | ■ |
| COGS | | |
| Inventory turnover ** | ■ | ■ |
| Net income | | |
| Profitability ratios | ■ | ■ |
| Taxes | | |
| Working capital | | |
| Cash flows | | |

* Current ratio = current assets/ current liab.

** Inventory turnover = COGS / avg. inventory

[Example]

Balance Sheet

| <u>Assets</u> | <u>12/31/2002</u> | <u>12/31/2001</u> |
|----------------------|-------------------|-------------------|
| Cash | \$105 | \$95 |
| Accounts receivable | 205 | 195 |
| Inventory | <u>310</u> | <u>290</u> |
| Total current assets | \$620 | \$580 |
| Gross PP&E | 1,800 | 1,700 |
| Accumulated depr. | (360) | (340) |
| Net PP&E | <u>1,440</u> | <u>1,360</u> |
| Total assets | <u>\$2,060</u> | <u>\$1,940</u> |

Liabilities and Shareholders' Equity

| | | |
|-----------------------------------|----------------|----------------|
| Accounts payable | \$110 | \$90 |
| Short-term debt | 160 | 140 |
| Current portion of long-term debt | <u>55</u> | <u>45</u> |
| Current liabilities | \$325 | \$275 |
| Long-term debt | 610 | 690 |
| Deferred taxes | 105 | 95 |
| Common stock | 300 | 300 |
| Additional paid-in capital | 400 | 400 |
| Retained earnings | <u>320</u> | <u>180</u> |
| Common shareholders equity | 1,020 | 880 |
| Total liabilities & equity | <u>\$2,060</u> | <u>\$1,940</u> |

Income Statement

For the Year Ended December 31, 2002

| | |
|--------------------|----------------|
| Sales | \$4,000 |
| Cost of goods sold | <u>(3,000)</u> |
| Gross profit | 1,000 |
| Operating expenses | <u>(650)</u> |
| Operating profit | 350 |
| Interest expense | <u>(50)</u> |
| Pretax income | 300 |
| Income tax expense | <u>(100)</u> |
| Net Income | <u>\$200</u> |
| Common dividends | \$60 |

Footnote: The firm uses the LIFO inventory cost-flow assumption to account for inventories. The LIFO Reserve in 2002 was \$100; in 2001 it was \$90.

For 2001

$$\text{FIFO inventory} = \text{LIFO inventory} + \text{LIFO reserve} = \$290 + \$90 = \underline{\underline{\$380}}$$

For 2002

$$\text{FIFO inventory} = \$310 + \$100 = \underline{\underline{\$410}}$$

$$\text{FIFO COGS} = \text{LIFO COGS} - \Delta \text{LIFO Reserve} = \$3,000 - (100 - 90) = \underline{\underline{\$2,990}}$$

Based on accounting figures that are most appropriate to compare to industry norms,

$$\text{Net profit margin} = \text{net income under LIFO} / \text{sales} = 200 / 4000 = \underline{\underline{5\%}}$$

$$\begin{aligned} \text{Current ratio} &= \text{current assets FIFO} / \text{current liabilities} \\ &= (\text{current assets LIFO} + \text{LIFO reserve}) / \text{current liabilities} \\ &= (620 + 100) / 325 = \underline{\underline{5\%}} \end{aligned}$$

$$\begin{aligned} \text{Inventory turnover} &= \text{COGS under LIFO} / \text{average inventory under FIFO} \\ &= 3000 / [(380 + 410) / 2] = \underline{\underline{7.6}} \end{aligned}$$

$$\begin{aligned} \text{Debt-to-equity} &= \text{long-term debt} / \text{equity under FIFO} \\ &= 610 / \{1020 + [100 \times (1-33\%)]\} = \underline{\underline{56.12\%}} \end{aligned}$$

講師提示

存貨分析之重點為使用「先進先出法(FIFO)」及「後進先出法(LIFO)」對資產、盈餘及各項重要財務比率之影響。
